

HVAC

We are pleased to inform you that we have taken significant steps to enhance indoor air quality in all of our buildings. The Board of Trustees recently approved (at considerable expense) the installation of air purification systems in our HVAC units that use a technology known as Needlepoint Bipolar Ionization (NPBI). These systems are designed to constantly clean the air in classrooms and other spaces. This new investment in our air purification systems, along with regular changing of high-quality filters and our on-going preventative maintenance program, will provide our community with a very clean indoor air environment.
